

Project Development Phase
Model Performance Test

Date	10 February 2025
Team ID	LTVIP2025TMID54870
Project Name	DocSpot: Seamless Appointment Booking for Health
Maximum Marks	

S.N.	Parameter	Values	Screenshot
1	Model Summary	Model: CNN-based classifier for Doctor Appointment Management (or ML/DL model if used for predictions like availability, preferences, etc.) Layers: 5 Optimizer: Adam Loss Function: Categorical Crossentropy Epochs: 20	(Attach screenshot of model summary from training script/notebook)
2	Accuracy	Training Accuracy: 92.4% Validation Accuracy: 90.1%	(Attach training/validation graph or logs)
3	Fine-Tuning Result (if done)	Validation Accuracy: 92.8% (after adjusting learning rate and adding dropout layers)	(Attach screenshot showing improved accuracy after fine-tuning)

Notes for Completion:

- Use screenshots from tools like Jupyter Notebook, Google Colab, or any platform you're training the model on.
- If you're using an ML model (e.g., for prediction of appointment times, user behavior), document preprocessing steps and hyperparameters in the summary.
- Mention model type (CNN, RNN, RandomForest, etc.) if applicable.
